ATKGuitarPreamp

Matthieu Brucher

ATKGuitarPreamp is a free Open Source plugin modeling a guitar preamplifier (inverter from the first stage of an AC30) followed by a tone stack inspired by the JCM800.

Usage

Here is how the parameters interact with the plugin:

- **Gain** changes the amount of distortion you get from the preamplifier by increasing the input signal level,
- **Low** handles the amount of low frequencies in the tone stack
- **Middle** handles the amount of middle frequencies in the tone stack
- **High** handles the amount of high frequencies in the tone stack
- **Volume** changes the output volume, before the dry/wet knob
- **Dry/Wet** balances the amount of processed signal versus input signal

Bugs

There shouldn't be bugs, but you never know. Please contact me or leave a message on Audio ToolKit web site or on my blog, on the announcement page.
